AMAZING IDEAS.!

BHASWARA 2K'17

Number of participants: 64

Rules for the Event:

- The idea should be creative enough.
- It should be feasible.
- Presentation should be on point.
- No deviation from the topic.
- Google help can be taken.(not mandatory)

Mark Sheet:

	Marks awarded
Creativeness in the Idea	5m
Feasibility	5m
Presentation	5m
Deviation from the topic	5m
Google help	5m

Geethanjali College of Engg. and Tech. Cheeryal (V), Keesara (M), Medchal Dist (T.S.)-501 301.

Winners of the Event:

1st Prize: P. Anil Kumar

K. Vinay Kumar

2nd Prize: Deshmukh Janhavi Ravindra

V. Prashanth

3rd Prize: Aashika

Lakshmi

Doing Known Things Fast

About the Event:

- **Duration**: 3 Hours
- Consists of 3 rounds
 - Round-1 (Basic Mathematics Written Exam with 15-20 Questions with time limit of 10minutes)
 - Round-2 (Reverse Streaming the one with speed and clarity will be further proceed to next round)
 - Round-3 (Visual Memory Testing and Reproducing)

Rules:

- 1. After registration we will give explain about the event.
- 2. Participants should not interact with the other contestant during the event.
- 3. The contestant is not supposed to use any gadgets.

Number of Participants: 52.

Winners List:

Report on TECHEXPO-18

TECHEXPO-18, a Fifth National level Hardware and Software project competition was conducted on 24th March 2018 in association with the ISTE professional body. Techexpo is a forum for motivating budding engineers to unleash their hidden technical talent by way of showcasing their projects which are implemented in hardware and/or software. With this intention, Techexpo was introduced in the year 2014 by the department. A total of 109 batches participated in the competition, out of which 25 batches were from various reputed colleges namely CVR College of Engineering, Vardhaman Engineering college, TKR, St.Peters Engineering college, Nalla Narasimha Reddy engineering college, Holy Mary Institute of Technology & Science, Bhoji Reddy, AVN Institute of Engineering and Tehnology, etc.

Prof. C.R. Sharma, an Electronics engineer from Madras Institute of Technology (now Anna University) & Vice chairman, IETE, Hyderabad center and Dr.A.V.Narasimha Rao, Professor, CBIT were invited as External judges. The competition was inaugurated by them at 11:00AM on 24th March 2018 in the presence of Dr.Udaya Kumar Susarla, the principal of the college, Prof. B. Hari Kumar, HoD, ECE and Dr C V Narasimhulu Professor and Coordinator of the event. The judges were accompanied by Dr. S. Suryanarayana and Prof. OVPR. Siva Kumar of the department, who supported in evaluating the mini and major projects demonstrated in different labs of the department. The projects are evaluated based on the following criteria: Innovation, Application to the societal needs, Demonstration of prototype and Presentation skills.

Few abstracts of TechExpo-18 are given below.

Abstracts

1. Android based Robot:

K.Dhenu Sri, K.Aishwarya, K.Prashant

Today the field of robotics is gaining popularity, because of their intelligence. These robots are performing a variety of activities in different fields. In this new era of robotics, continuous path tracking robots are drawing much importance because of their sophisticated closed loop control with completely automation features. The robot designed here is also controlled through android device via Wi-Fi. The main theme of this project work is to design and develop a robot that can be operated as a line following robot as well as control the robot through android device for reading different parameters like obstacle, pit detection and fire sensing.

The robotic vehicle designed here follows the line/path marked with black paint in a closed loop and senses the parameters that are constructed with sensing circuits on the vehicle. The path sensing sensors are arranged at the front bottom end of the vehicle and DC motors are used to drive the wheels. The microcontroller used in this project work is programmed to control the motors independently. Two DC motors with reduction gear mechanism are used to drive the robot and depending upon the control signals received in the input through the sensors or the android device; the output is controlled by the controller. The two DC motors are connected to the rear wheels of the vehicle for the vehicle movement. The required power supply for the vehicle is provided through the high power rechargeable battery of 12V.

The advancement of technology has made possible the implementation of embedded systems in each and every field. This has added new capabilities and features. However most of the time, the implementations are proprietary and networking is not always possible. Yet there is

Goethanjali College of Engg. and Tech. Cheeryal (V), Keesara (M), Medchal Dist (T.S.)-501 301. an increasing demand for advancements, where devices react automatically to changing environmental conditions and can be easily controlled through one common device. This project work presents a possible solution whereby the user controls the robot for fire sensing, pit or obstacle sensing by a mobile phone through its android interface. This results in a simple, cost effective and flexible system, making it an excellent feature for future smart robotic operations.

2. Rasberry Pi based Intruder alert system

G.Koulini, E. Nikhita, A.Jyothirmaye, Ch.Hari Prasad

In the world of <u>Internet of Things (IoT)</u> when we have all the technologies to revolutionize our life, it's a great idea to develop a system which can be controlled and monitored from anywhere. There are many types of good security systems and cameras out there for home security but they are much expensive. So the scope of this project is to build a low cost simple **Raspberry Pi based Intruder Alert System**, which not only alerts you through an email but also sends the picture of Intruder when it detects any.

In this <u>IoT based Project</u>, we built a **Home Security System using PIR Sensor and PI Camera**. This system detects the presence of Intruder and quickly alerts the user by sending him an alert email. This email also contains the Picture of the Intruder captured by Pi camera. Raspberry Pi is used to control the whole system. This system can be installed at the main door of your home or office and you can monitor it from anywhere in the world using your Email over internet

3. Voice enabled switching of electrical appliances for visually impaired persons

Harika Devi, K.Ramya Sri

The main aim of this project is to design and construct a voice enabled device switching system for physically challenged and also to alert using GSM modem. User can also control the electrical devices like light, fan etc. with the help of voice recognition system. This device is very helpful for paralysis and physically challenged persons. The GSM modem provides the communication mechanism between the user and the predefined number through SMS messages. This project makes use of a Relay for switching the devices and voice recognition chip for recognition of the audio announcements and Microcontroller, which is programmed, with the help of embedded C instructions. This microcontroller is capable of communicating with all input and output modules. The voice recognition system which is the input module to the microcontroller takes the voice instruction given by the user as input and the controller judges whether the instruction is ON/OFF of the device, and according to the users voice, the switching mechanism controls the devices. An alerting SMS message is sent to the mobile phone using GSM modem and the status of the device is displayed on LCD

4. Real Time Face Detection:

M.Mridula Gayatri, T.Vamshi Teja, T.Shravan

Face detection is an easy and simple task for humans, but not so for computers. It has been regarded as the most complex and challenging problem in the field of computer vision due to large intra-class variations caused by the changes in the facial appearance, lighting and expression. Such variations result in the face distribution to highly non linear and complex in any space that is linear to the original image space.

Object detection and tracking are important in many computer vision applications, including activity recognition, automotive safety and surveillance. Presented here is a face detection using MATLAB system that can detect not only human face but also eyes and upper body. This face detection using MATLAB program can be used to detect a face, eyes and upper body on pressing the corresponding buttons.

5. Voice activated Home automation using Arduino

Shaik Sameer Ali, A.Navya, V.Pooja

Geethanjali Callege of Engo. and Tech. Cheeryal (V), Keesara (M), Medchal Dist (E.S.)-501 301. In this fast paced life of 21st century, automation plays a key role in human life. Home automation allows us to control household electrical appliances like light, door, fan, AC etc. Home automation not only refers to reduced human efforts but also energy efficiency and time saving. The main objective of home automation is to help handicapped and old aged people to control home appliances.

This project puts forward the implementation of home automation system in which we use the android operating system to control the appliances. Home appliances are connected to the microprocessor and communication is established between the Arduino and Android mobile device or tablet via Bluetooth module. We would develop an authentication to the system for authorized person to access home appliances. It presents the design and implementation of automation system that can monitor and control home appliances via any Android device.

This project "Voice Controlled Home Automation" helps to control the appliances through voice commands received via android application. The integration of control unit with Bluetooth device is done to capture and read the voice commands. The Arduino controller then operates as per the command received via android application. For this, ATMEGA 328 microcontroller is integrated in the system which makes it possible to control the appliances via Android application.

The controlling device may be any Android based Smartphone/tab etc, having an Android OS. The Android controlling system provides a good interactive GUI that makes it easy for the user to control the devices. The receiver end reads these commands and interprets them into controlling the domestic appliances.

The android device sends commands to switch ON/OFF the appliances. After receiving the commands, the Arduino processor controls the equipments accordingly through the relays. The communication between Android device and receiver is sent as serial communication data. In this project work for the demo purpose, one simple voice controlled home automation system is designed, which controls light and fan depending on the input voice commands.

6. Design and Implementation of Drone (unmanned aerial vehicle, UAV) with camera using Arduino Board

A.Reethika, D.Mani Kanta

Sustainability is at the heart of many application fields where the use of Unmanned Aerial Systems (UAS) is becoming more and more important (e.g., agriculture, fire detection and prediction, environmental surveillance, mapping, etc.). However, their usage and evolution are highly conditioned by the specific application field they are designed for, and thus, they cannot be easily reused among different application fields. From this point of view, being that they are not multipurpose, we can say that they are not fully sustainable. Bearing this in mind, the objective of this project is two-fold: on the one hand, to identify the whole set of features that must be provided by a UAS to be considered sustainable and to show that there is no UAS satisfying all these features; on the other hand, to present an open and sustainable UAS architecture that may be used to build UAS on demand to provide the features needed in each application field. Since this architecture is mainly based on software and hardware adaptability, it contributes to the technical sustainability of cities.

7. Smart Ration Distribution (FPD) using RFID and biometric for avoiding malpractices E.Nikhita, M.Divya, Rudra Vamshi

India's Public Distribution System (PDS) is the largest ration distribution system in the world. Public distribution system provides a ration card to peoples and from that card, they will be able to purchase materials like rice, wheat, kerosene, and oil. State Government issues different ration cards like yellow ration card, saffron ration card, and white ration card depending on family annual income. The consumer material is supplied to ration card holders in the first week of every month by ration shopkeeper. Ration distribution system in India is not without its defects. The ration shop owner illegally uses consumer materials without prior

Geethanjali College of Engg. and Tech. Cheeryal (V), Keesara (M), Medchal Dist.(I.S.)-581 381. knowledge of ration there consumer. The proposed system aids to control malpractices which are present in ration shop by replacing manual work with an automatic system based on RFID. The RFID card has a unique identification number and details of a consumer. The consumer scans the card on RFID reader which is interfaced with microcontroller kept at ration shop. Once a consumer is validated by the mean of Biometric, the system shows customer's product and cost. Based on the material chosen by the consumer, the appropriate bill will be generated and the consumer gets the material. The proposed RFID and Biometric based automatic ration shop system would bring transparency and prevent malpractices

8. Design of low power and high speed radix 2Butterfly structure using multipliers and adders

D.Keerthi, C Shiva Kumar, T Sai Bhuvan

In the FFT computation, the butterflies play a central role, since they allow calculation of complex terms. In this calculation, involving multiplications of input data with appropriate coefficients, the optimization of the butterfly can contribute for the reduction of power consumption of FFT architectures. In these paper different and dedicated structures for the 16 bit-width radix-2 and radix-4 DIT butterflies are implemented, where the main goal is to minimize the number of arithmetic operators in order to produce power-efficient structures. Firstly, we improve a radix-2 butterfly previously presented in literature, reducing one adder and one subtraction in the structure. After that, part of this optimized radix-2 butterfly is used to reduce the number of real multipliers in the radix-4 butterfly. The main results show that the optimization guarantees reduced power consumption for radix-2 butterfly, when compared with previous works from the literature. Moreover, the use of part of the optimized radix-2 into the radix-4 structure leads to the reduction of power consumption for this structure.

9. Safety and security vehicle based parking system using GSM

Nikhitha Ragi, P. Karan Kumar, N.Vishal Chaitanya

This project is to develop a safety and security in RFID based vehicle parking system using GSM to overcome the problem of unnecessary time consumption in finding parking spot in commercial parking areas. In this proposed system, we reserve the parking slot in shopping malls, theatres and offices by using short message service (SMS). User reserves the slot by sending a message to GSM modem placed at the parking end. GSM modem gives slot number and a password if the slots are available which is used to allow access to the parking area at the entrance controlled through a gate. The gate mechanism is controlled through a small DC motor. If there are no parking slots free, or if the password entered is wrong, the gate will not be opened at the entrance and will deny the entry of the vehicle automatically. IR sensors are used for the indication of the slots whether filled or empty to the control unit. This information will be displayed in the digital display by the controller. User can park the vehicle at the given slot. RFID technology is used for entering the parking area and also used to debit the amount for parking charges through RFID tag. RFID is the special type wireless card which has inbuilt the embedded chip along with loop antenna. The inbuilt embedded chip represents the 12 digit card number. RFID reader is the circuit which generates 125 KHZ magnetic signal. This magnetic signal is transmitted by the loop antenna connected along with this circuit which is used to read the RFID card number.

The main objective of the system is to uniquely identify the vehicle. This requires a unique code, which has the capability of distinguishing different vehicles. This is possible by the new emerging technology RFID (Radio Frequency Identification). The main parts of an RFID system are RFID tag (with unique ID number) and RFID reader (for reading the RFID tag). The microcontroller internal memory is used for storing the details. When the vehicle leaves the parking slot through the exit gate, some amount will be deducted from the RFID tag. So if the vehicle comes to the parking slot again after reservation and the balance in the card is low or nil, the gate at entrance will not be opened and an alarm will be raised as

Geethanjali College of Engg. and Tech. Cheeryal (V), Keesara (M), Medchai Dist (ES.)-501 301 acknowledgement. The main contribution is the system has more security and saves time for the users finding the parking slot. Thus users can just reserve the parking slots using the SMS.

10. Wheel Chair based mobility assist using voice recognition using Arduino

M. Venkat Rohit, M. Vinil, Vijaya Bhaskar

The power of Arduino and simple sensors to build a Blind man's stick that could perform more than just a stick for visually impaired persons. This Smart stick will have an Ultrasonic sensor to sense distance from any obstacle, LDR to sense lighting conditions and a RF remote using which the blind man could remotely locate his stick. All the feedbacks will be given to the blind man through a Buzzer. Of course you can use a vibrator motor in place of Buzzer and advance a lot more using your creativity. Arduino Nano is used to control all the sensors. The Ultrasonic sensor, the trigger and Echo pin is connected to Arduino nano.

11. Smart Blind stick using Arduino

B. Srikanth Reddy, B.Manasa, R.Srikenth

There are many devices for visually impaired people. This project is also an attempt to develop an aid for visually impaired persons. This project is a smart stick which is capable of detecting any obstacle, detect water and corners and even allow the user to find the stick if anyhow missed by the user by pressing a remote switch. The device is designed with an intention to sort out common issues faced by the blind people while using traditional sticks. With the electronics embedded within the stick, it became a smart stick with the functionalities mentioned above.

The smart stick is built on Arduino Pro Mini. This Arduino board is small enough to install on a regular stick and has buzzer, LDR sensor, Ultrasonic sensor and a water detector sensor interfaced to it. The stick also has an RF receiver which connects with an RF transmitter that acts as a remote for finding the stick on missing. The remote built on RF transmitter has a switch pressing which, the buzzer installed on the stick is triggered and by the sound of the buzzer a blind person can find the stick. The ultrasonic sensor detects obstacles and LDR sensor allows determining the lighted and dark places. A water indicator is also installed at the base of the stick which invokes an alarm if the person is going step into any wet place.

The Arduino sketch manages to detect an obstacle, sense light, and water and invoke alarm on the press of the remote switch. The sketch is written on Arduino IDE and burnt to the controller board using the same. For demonstration, the circuit is built on a breadboard and it can be easily installed on any regular blind stick.

12. Students Attendance Monitoring Systm using Raspberry Pi 3

Ankitha, Sushma Sri

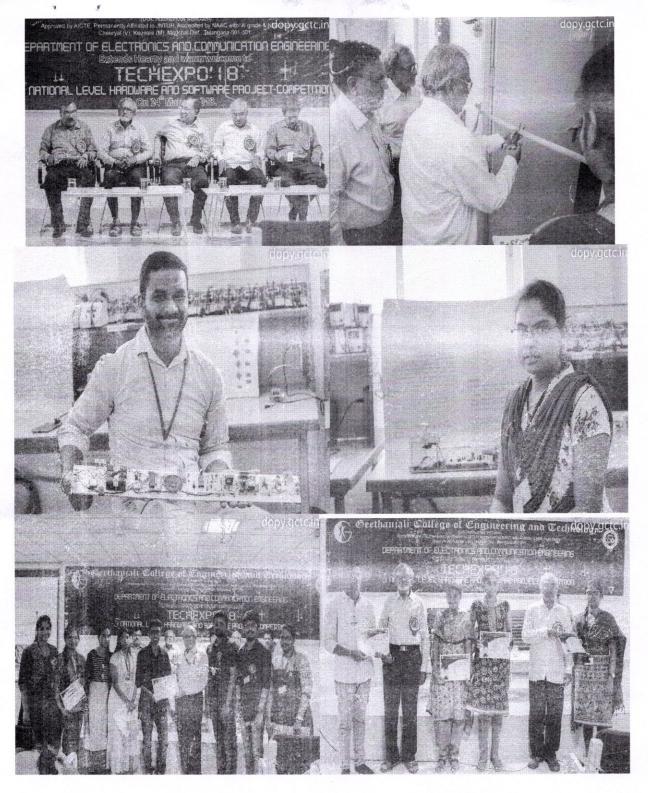

Attendance marking is one of the important tasks in each and every institute. There are many ways to maintain attendance of students with traditional methods and automated system. This paper aims at providing one of the efficient methods for taking attendance and finds current location of the student. The attendance will be marked based on location of the student. In this proposed system the student will carry a phone having GPS system which sends GPS location to Raspberry PI enabled GPS module to replace a computer system. Each any room and nearby location of campus latitude and longitude values are stored in the database. In this paper the proposed system will consist of two modules Phone module and Raspberry PI modules. It helps teachers by reducing manual processes. Every Institute has a specific location, which is determine by the GPS. This paper use location as a proof for monitoring attendance of students.

Geethanjali College of Engg. and Tech. Cheeryel (M., Keesere (M), Medchal Dist.(I.S.)-501 301, Based on the evaluation, merit list (which includes prize amounts) was prepared as given below.

Sl.No	Name of the students	Title of the project	Cash Prize (in Rs.)	college	Category H/W
